

LOWERED WALLED GRC PLANTERS

Satu Bumi's CityScape "commercial grade" GRC planters are manufactured off site in sizes and shapes that are determined by a combination of the design requirements and the resulting practical transportation and installation logistics of a construction or landscaping project. However, to improve the aesthetic appearance of an installation of multiple planters, Satu Bumi can lower one or more of the internal walls of the planters so that after installation they appear to be one continuous planter from a plan view perspective. This lowered walled approach can also be used to overcome the logistical issues associated with the transportation and installation of very large GRC planters.

Lowered Rectangle Planter Walls

The end walls of a rectangle planter can be lowered in size during manufacture then abutted with another similar planter during installation to enable the two adjoining planters to appear to be one planter when viewed from above. If required, this approach can be extended to a long line of GRC planters with only the walls on the ends that abut each other lowered.

The height of the lowered walls would typically be low enough to enable the required depth of planting material and yet high enough to avoid any additional chance of water leakage.

Large Segmented Planters

This lowered wall approach can also be used when segmenting very large rectangle or round planters so that the segments can be manufactured off site, easily transported, then joined (which depending on the design, may include bolts), grouted and sealed on site for water proofing.
